**Your Health Coach and Today's Presenter:  
Curtis Arnold**

# Seeking longevity?

**Exercise is EVEN MORE IMPORTANT than  
your diet!**

# What Do We Know About Aging?

- Aging begins to accelerate in adulthood, with significant changes appearing around the age of 34.

# Biological aging is not linear - it occurs in bursts.

Notable acceleration spikes first at 34,  
then at 60, and again at age 78.

# What Causes Aging?

# Telomeres Shortening

Every time a cell divides, its telomeres get a little shorter.

When they get too short, the cell can no longer divide and becomes **SENESCENT** (Stops dividing)

# The Problem with Senescent Cells

- They accumulate in the tissues.
- Then they start to secrete **inflammatory molecules**.
- These molecules (inflammation) **damage neighboring healthy cells** leading to age related decline.

# Mitochondria

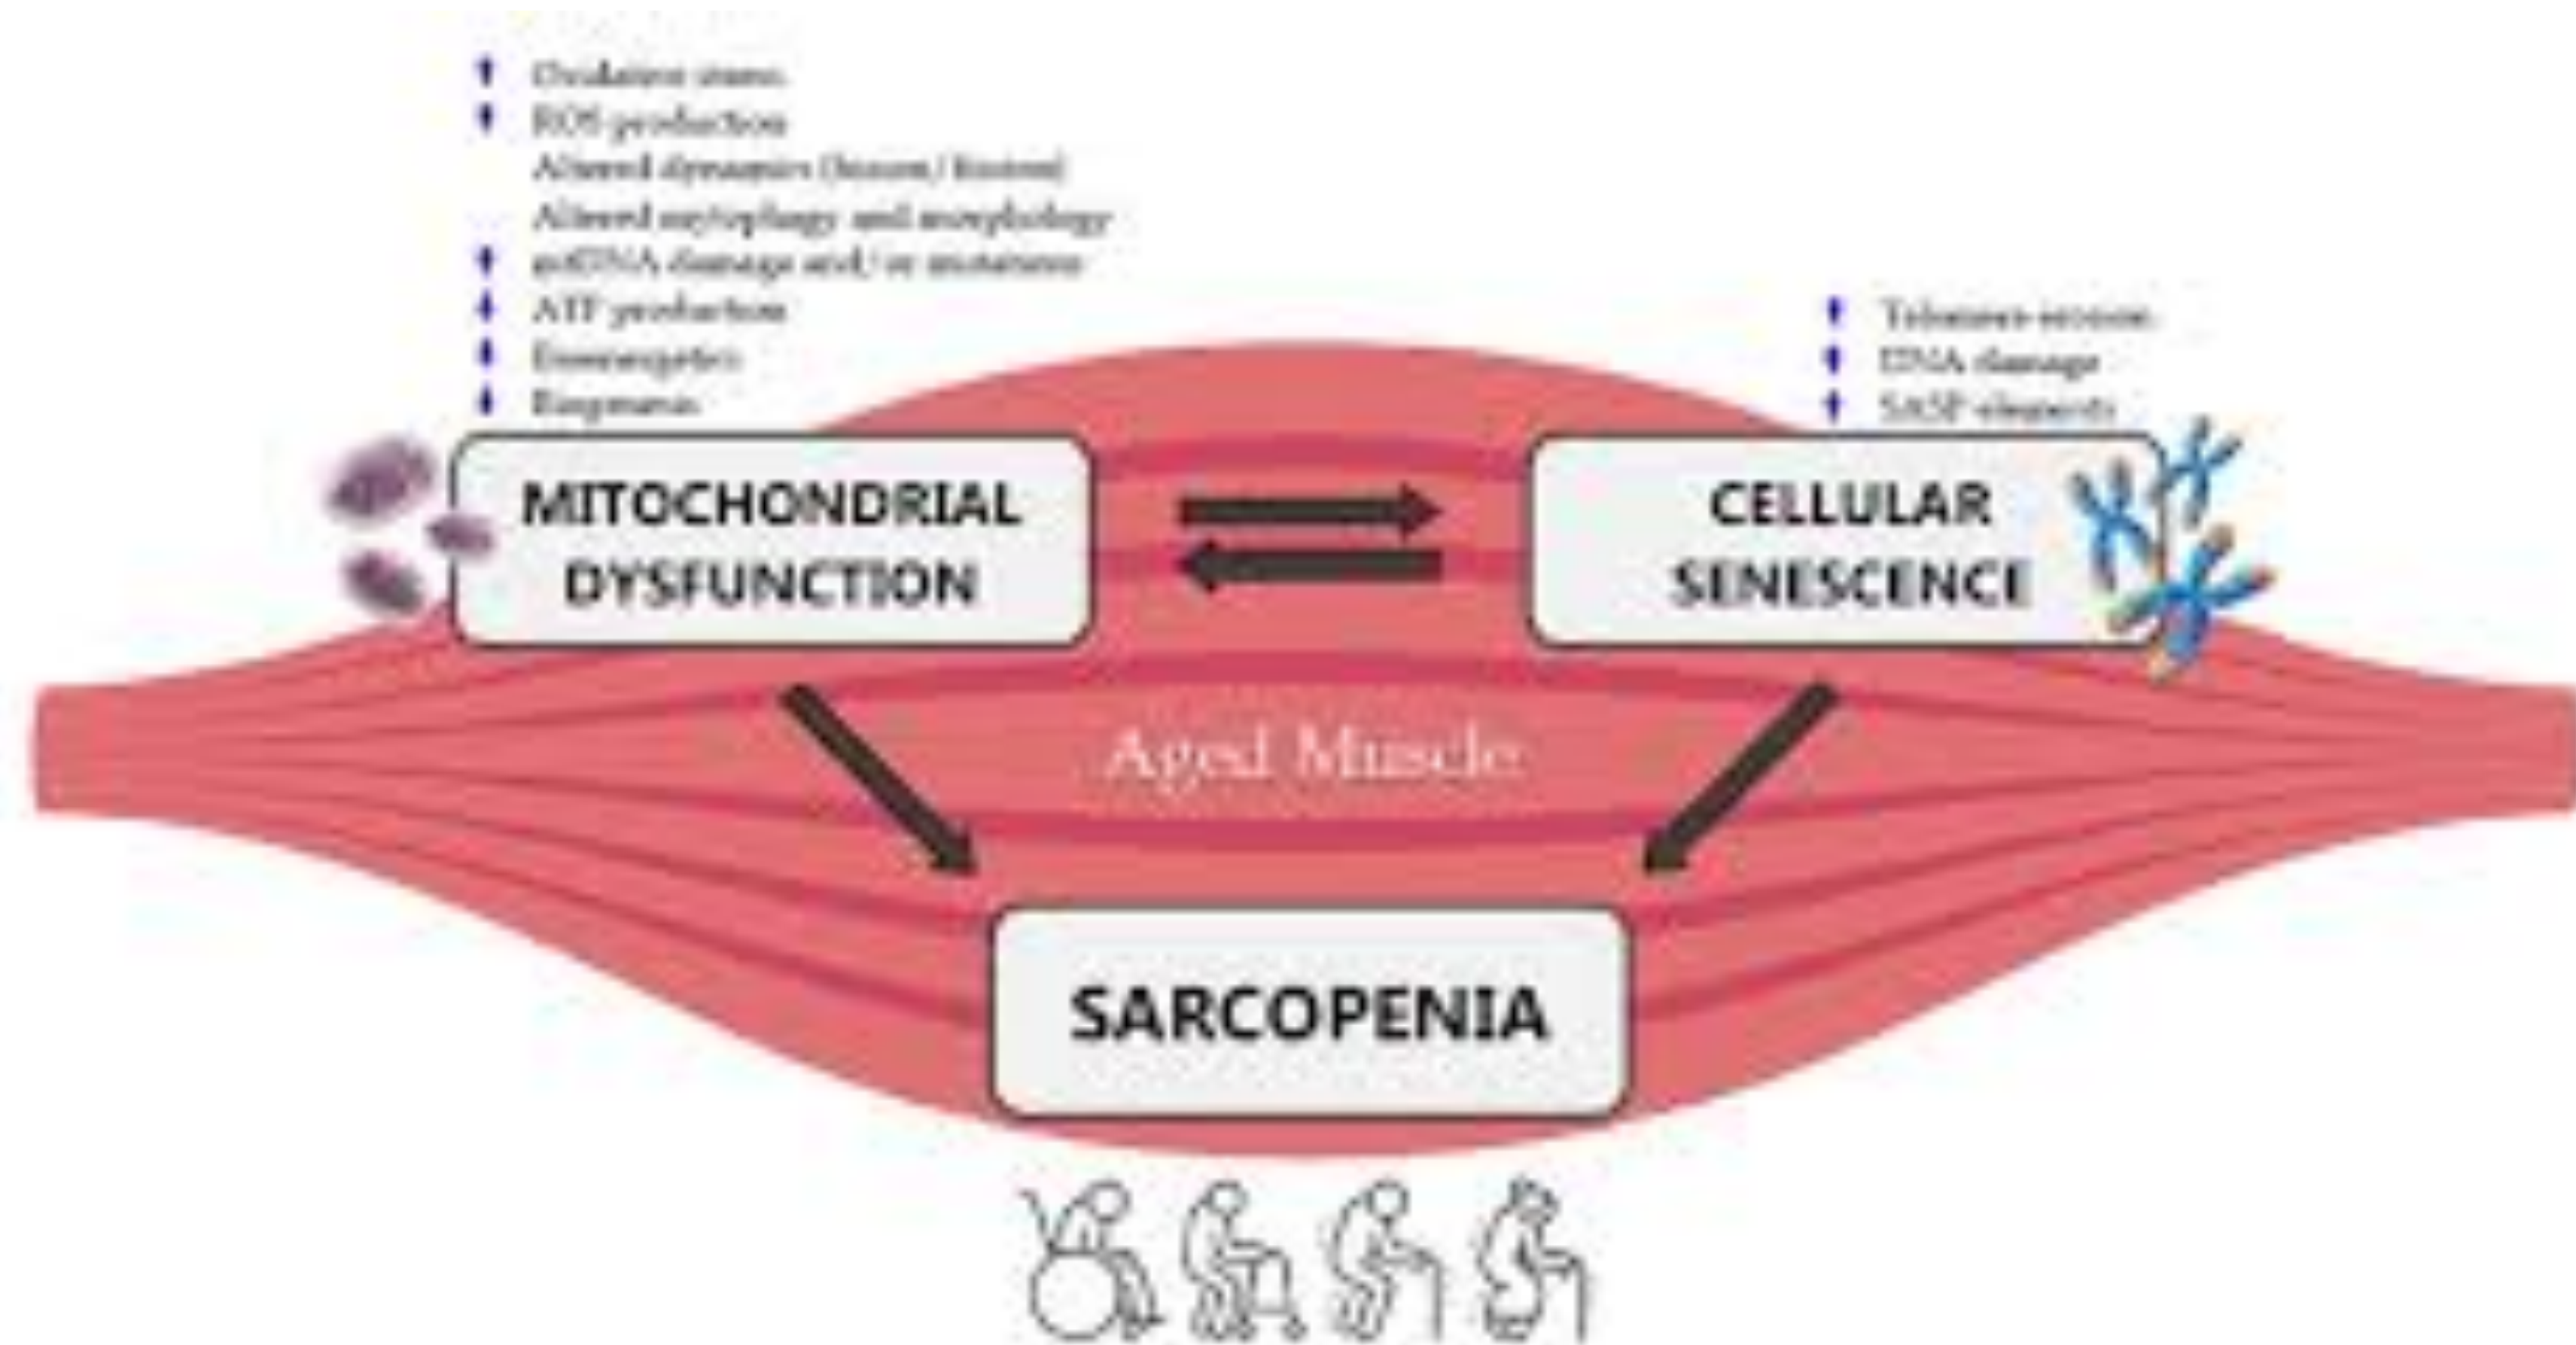

What are mitochondria?

They are the “engines” in every cell that produce the energy (ATP) needed for all cellular processes.

# Mitochondrial Dysfunction

Mitochondrial dysfunction combined with cellular senescence contributes to the decline of tissues and muscles (sarcopenia).

# Aging Causes an Increase in Metabolic Diseases

Both **senescent cells** and **dysfunctional mitochondria** contribute to aging and age related diseases.

But we also have a solution!

# The Solution: EXERCISE

Nothing surpasses regular exercise for the promotion of healthy living.

Exercise can be viewed as the single most effective medical intervention that we know.

# Here's What's Getting Better with Exercise

- Mitochondrial function
- Cardiovascular system
- Skeletal muscle
- Brain
- Peripheral blood vessels
- Immune system

# I'm Too Busy!

- One minute of high intensity exercise gives you 8 minutes of extra life.
- 450 minutes a week of brisk walking gives you 4.5 years of extra life. (650,000 people in this study)

# Meta-analysis of 196 Studies on the Benefits of Exercise

- 30 million participants.
- 31% reduction of all-cause mortality.
- More activity = more benefits.

# Exercise Guidelines - Types of Exercise

## Moderate

- Walking
- Bicycling
- Dancing
- Gardening

## Vigorous

- Jogging
- Swimming
- Aerobics
- Elliptical

# Meeting the Guidelines

Moderate - 150  
minutes/week.

Vigorous - 75  
minutes/week.

One in four Americans  
meet the guidelines

# Exercise and Cancer

The study: 75,000  
participants followed  
for 10 years.

The result: More exercise,  
less cancer.

# Exercise and Dementia

**Study:** 78,000 participants followed for 7 years.

**Result:** Lower rates of dementia due to increased brain neurogenesis.

# Cardiovascular Health

# Cardiovascular Disease

## WHAT IS CARDIOVASCULAR DISEASE (CVD)

---

Symptoms & Causes

# Cardiovascular Disease - Two Types

6.2 million adults in the U.S have heart failure.

A progressive disease - the heart can't pump enough blood.

# Cause of Heart Attacks

## Atherosclerosis

# Heart Failure

The heart can't pump enough blood - **ejection fraction**.

# A Sad Fact

The statistics are nearly equal for men.

# Review

- Aging spikes at age 34, 60, and 78.
- Aging is a function of cells not performing their jobs as they once did.
- Mitochondria are the “engines” in every cell that produce the energy needed for all cellular processes.

# Review

- Exercise can be viewed as the single most effective medical intervention that we know.
- A one hour walk each day can add 4 1/2 years to your life.
- Exercise can reduce your risk of getting cancer.

# Cardiovascular Health

# Enhancing Heart Health Through Cardio

- Helps the heart pump **more efficiently**.
- Decreases the risk of **heart attacks and strokes**.
- Increases the efficiency of **oxygen delivery** through the body.

# Enhancing Metabolic Health Through Cardio

- Creates a caloric deficit.
- Increases the rate your body burns calories.
- Reduces risk of diabetes.

# Enhancing Mental Health Through Cardio

- Increases release of endorphins, lifting mood.
- Improves memory by increasing blood flow to the brain.
- Improves sleep.

# Enhancing Longevity Through Cardio

- Has been linked to longer lifespan.
- Lowers the likelihood of developing a chronic disease.
- Improves overall physical function and independence in daily activities.

# Understanding Exercise Intensity Zones

**Intensity Zones** refers to the level of effort in a physical activity.

Zone 2 is moderate - the **aerobic** zone.

Zone 5 is high intensity - the **anaerobic** zone.

Both **zones** offer unique benefits and are essential for a well-rounded fitness routine.

# Zone 2 - the Aerobic Zone

**Definition:** Moderate intensity. You can hold a conversation but feel slightly out of breath.

## **Zone 2: 65-74%**

- Fat as Fuel
- Metabolic Flexibility
- Decreased Blood Pressure
- Increased Insulin Sensitivity

**Heart rate:** 65 - 74% of maximum.

## Zone 2 Examples

Brisk walking.

Easy jogging.

Cycling at a steady pace.

# Zone 5 - the Anaerobic Zone

**Definition:** High intensity. Talking is difficult and effort is near maximum.

**ZONE 5**  
Heart Rate Training  
Explained

[www.runtothefinish.com](http://www.runtothefinish.com)

**Heart rate:** 90 - 100% of maximum.

# Zone 5 Examples

Any type of exercise -  
running, cycling, treadmill,  
elliptical, etc. can be used to  
perform **HIGH INTENSITY  
INTERVAL TRAINING.**

There are several popular types, each involving differences in the times between intensity and rest.

# Zone 5 - REHIT Training (Reduced Exertion High Intensity Interval Training)

Designed to be as short as possible while still triggering a powerful physiological result.

- Warm-up - 2 minutes.
- Sprint - 20 seconds.
- Recovery - 3 minutes.
- Sprint - 20 seconds.
- Cool down - 3 minutes.

# REHIT Sprint

You must sprint like you are running from a tiger for 20 seconds. Rest three minutes, then do it again.

# REHIT Benefits

- Your body undergoes adaptations at a cellular level, increasing the efficiency of mitochondria.
- Improves insulin sensitivity.
- Improves fat burning.

Improves your VO2 max (measures cardiovascular fitness).

# REHIT Advantage

- Very similar benefits to other Zone 5 training methods with far less time commitment.
- Should only be done twice a week.

# VO2 Max

The maximum oxygen used during exercise.

Best indicator of both aerobic and cardiovascular fitness.

# Improving VO2 Max

Both **HIIT** and **LSD** (long slow distance training) can have a positive affect on VO2 max.

# A Training Program Combining Zone 2 and Zone 5

Monday: Zone 2 (45 - 60 minutes).

Tuesday: REHIT (10 minutes).

Wednesday: REST DAY.

Thursday: Zone 2 (45 - 60 minutes).

Friday: REHIT (10 minutes).

Saturday: Zone 2 (45 - 60 minutes).

Sunday: REST DAY.

# Review

- Cardio can reduce the risk of heart attacks and strokes.
- Cardio reduces the risk of diabetes.
- Cardio can improve mood, memory and sleep.
- Cardio lowers the likelihood of developing a chronic disease.

# Review

- You must incorporate both **Zone 2** and **Zone 5** training into your fitness routine.
- **REHIT Training** can significantly reduce the time you spend doing cardio exercise.
- **VO2 Max** is the strongest predictor of life expectancy.

# Strength Training

# Strength Training

You age in this order:

- First you lose power.
- Next you lose strength.
- Then you lose muscle mass.

# Strength Training

Resistance Training involves using weights, bands, or body weight to build muscle strength and endurance.

# Why Seniors Need Resistance Training

As we get older, the age-related decline in muscle mass and strength – known as sarcopenia – is one of the major impediments to performing the tasks of daily living, yet this process may not be as inevitable as it is often assumed to be.

---

Peter Attia, M.D.  
Weekly Newsletter

1/10

As we age, muscle mass and strength gradually decline.

That is called  
**SARCOPENIA.**

# Benefit #1 - Improved Muscle Strength and Function

Resistance training  
increases muscle  
strength, making daily  
activities easier and  
reducing the risk of falls.

## Benefit #2 - Increased Bone Density

Weight bearing exercises stimulate bone growth, helping to prevent osteoporosis.

Stronger bones reduce the risk of fractures and improve overall skeletal health.

## Benefit #3 - Increased Metabolic Health

- Increased muscle mass causes more calories to be burned at rest.
- Muscle mass also increases insulin sensitivity, reducing the risk of Type 2 Diabetes.

## Benefit #4 - Better Mental Health and Cognitive Function

Reduces symptoms of  
depression and anxiety in  
older adults.

May slow down age related  
mental decline.

## What You learned Today

- Aging is caused by senescent cells and mitochondrial dysfunction.
- Exercise is the single most effective intervention to prevent aging.
- A brisk walk every day can add 4.5 years to your life.
- Exercise can decrease your risk for Cancer, Dementia, and Cardiovascular Disease.

# Review

## What You learned Today

- Cardio Training increases your VO2 Max, the number one predictor of longevity.
- You must combine both Zone 2 and Zone 5 Training for optimal benefits.
- 3 million seniors are hospitalized each year due to falls.

# Review

## What You learned Today

- Resistance training improves muscle strength, increases bone density, increases metabolic health, and improves cognitive function.
- 3 million seniors are hospitalized each year due to falls.
- Balance exercises can prevent you from being one of them.
